## Energy Boosters

### Ways to Get You Through the Day

Rebecca Jones

No amount of coaxing, pleading, or pedal pumping could get the engine in the rental car to turn over. It was going nowhere. The travelers had filled the car with unleaded fuel, but it had a diesel engine. It had been able to run a little way on the wrong fuel, but not far. And when it finally stopped, it stopped for good.

Sometimes cars and humans aren't so different. Both need the right fuel to run at maximum efficiency. Put too much of the wrong stuff in, and a breakdown may be unavoidable.

Here are some tips to keep your body humming along like a well-tuned engine, full of energy.

so-called "energy bars" are unpalatable but good for you, while candy bars are delicious but bad. Many energy bars are filled with sugar, so read labels, and look for high fiber, high protein, and limited carbs.

Nuts are among the best choices for healthy, pick-me-up snacks, nutritionists say. Nuts such as almonds, Brazil nuts, cashews, and hazelnuts are all loaded with magnesium, a mineral whose health benefits include improving heart health, decreasing the risk of diabetes, reducing stress, improving muscle functioning, and reducing insomnia.

Another super snack food is dark

*Many people look forward to the new year for a new start on old habits.*

You know you're supposed to get your eight hours!

### Be Snack Smart

Strategic snacking can be a good way to smooth out dips in your energy level and avoid hunger cravings that can lead you to overeat when you finally do sit down to a full meal. So go ahead and snack. Just be as choosy in your snack selection as you are in meal planning.

chocolate, which is rich in heart-protecting antioxidants and can improve blood flow, which will energize flagging muscles. Even milk chocolate gets a thumbs up because it provides calcium for the bones. So enjoy it--in moderation.

## Stay Hydrated

Just because you're not thirsty does not mean you aren't dehydrated, and even slight dehydration can leave you tired and lethargic. The answer is, of course, to drink plenty of water. If the taste of plain water doesn't excite you, consider some of the flavored varieties, keeping in mind that loads of extra sugar should be avoided.

One increasingly popular healthy hydration alternative is coconut water, which studies suggest may hydrate more quickly than plain H<sub>2</sub>O and which contains more potassium and less sodium than other energy drinks.

## Massage and More

The inherent demands of your life may lead to muscle strains, stress, and other conditions that can affect your energy levels. One of the best strategies is to get into a regular pattern of receiving massage. If you feel the need for some quick bodywork between sessions, consider self-massage possibilities.

One option is to use a foam roller, a firm foam log that comes in varying thicknesses--think of them as comfy rolling pins. You can use your own body weight to generate direct pressure as you roll over the roller, working out muscle knots.

Aromatherapy is also a great way to get a quick energy boost, as certain scents are able to fight fatigue. Queen among them is peppermint, and other lethargy busters include eucalyptus, citrus, cardamom, and even cinnamon and black pepper.

## Get Some Rest

The number one myth about sleep is that you can get by on six hours a night. The truth is that the further away you deviate from getting eight hours sleep a night--and some people get too much, not too little--the greater the risk of cardiovascular disease, depression, obesity, and a host of other maladies.

Make sleep a priority. Get on a regular schedule, stick to it, and stop allotting to sleep only whatever time is left over after everything else gets accomplished. Once you've gone to bed, though, you have to actually go to sleep, and for many people that's no easy feat.

Caffeine is often the culprit. Caffeine is a great pick-me-up first thing in the morning, but it has a six- to seven-hour "half-life," meaning that half the caffeine in that cup of coffee you consumed to ward off the 3:00 p.m. doldrums will still be lingering in your bloodstream after the 10:00 p.m. news.

Another stimulant many people don't often consider is light--particularly light from a computer or television screen. Dim light from a soft reading lamp is fine, but the bright blue light of electronic devices sears itself into our minds and fools them into thinking it's still daylight outside, which makes falling asleep seem unnatural.

Heat, whether internal or external, will also disrupt sleep. The ideal room temperature for sleeping is around 65 degrees. The cool air then wicks away heat from your body, which allows you to fall asleep. Anything you do to

increase your body's core temperature, like exercising or eating a big meal right before bedtime, makes it harder for your body to cool down to a comfortable sleeping temperature.

Naps are tricky luxuries. Taken wisely and in moderation, they'll restore mental alertness and fuel you through a long afternoon. But too long a nap or a poorly-timed nap will leave you feeling drained after you get up, and will make it harder to fall asleep come bedtime. Timing also matters. Grab a morning nap to boost your creativity and mental alertness or a late-afternoon nap to restore lost physical energy and boost your immune system--a nap around noon provides a little of both.

Snack smart and benefit from sustained energy throughout the day.

# What Is Reiki?

## Understanding Energy Work

A type of energy bodywork, reiki (pronounced ray-key) relies on the ancient belief in the life force energy, referred to as chi, that flows through all things. This life force runs throughout pathways in the body called meridians, nourishing organs and cells and supporting vital functions. When this energy is disrupted by negative thoughts, feelings or actions, illness and disease result. A reiki practitioner's hands hover just above a person's body, sensing the affected areas and infusing them with positive flow. This raises the energetic vibration and breaks up the negativity to heal, clear and restore the natural flow of the life force. The reiki practitioner, trained to access and serve as a channel for the life energy, places his hands on or just above the client's body and uses a passive touch that some clients experience with warmth or tingling. The hands remain in position for 3-5 minutes, alternately covering 10-12 positions over the body.

Thought to be Tibetan Buddhist in

origin, the practice of reiki is comprised of three levels of training. Through this training, the practitioner learns how to access energy flow through the hands to heal. Completion of the third and highest level of training results in the title of reiki master. Reiki is used to accelerate healing, assist the body in cleansing toxins, balance the flow of subtle energy by releasing blockages, and help the client contact the healer within.

According to [www.reiki.org](http://www.reiki.org), reiki is beginning to gain acceptance as a meaningful and cost-effective way to improve patient care in hospitals and clinics across America. In an interview on the website, Dr. David Guillion, an oncologist at Marin General Hospital in California, says, "I feel we need to do whatever is in our power to help the patient. We provide state of the art medicine in our office, but healing is a multidimensional process. I endorse the idea that there is a potential healing that can take place utilizing energy." For more information, consult your

bodywork practitioner.

Reiki balances subtle but vital energy.

# Identifying a Stroke

## Do You Know the Warning Signs?

Nearly 800,000 Americans have strokes every year. However, studies show most Americans don't know how to recognize five established warning signs that indicate when someone is having a stroke.

A stroke is when a blood vessel carrying blood to the brain either bursts or is blocked by a clot, thus depriving the brain of oxygen. According to the American Stroke Association, more than 137,000 people die each year from stroke--on average, that's one person every four minutes. Risk factors include age and heredity, as well as artery disease, diabetes, high cholesterol or blood pressure, physical inactivity, obesity, and smoking,

### Five Warning Signs

The best treatment for stroke is the drug

"tissue plasminogen activator" (tPA), but it must be administered within three hours from the first symptoms of the stroke to be most effective. To help ensure the quick recognition of a stroke, familiarize yourself with these five established warning signs:

- Numbness or weakness of the face, arm, or leg, usually on one side of the body.
- Sudden trouble walking and loss of balance.
- Sudden confusion and difficulty speaking.
- Severe headache with no obvious cause.
- Vision troubles from one or both

eyes.

Someone suffering a stroke may not show all five symptoms simultaneously, but if any of these conditions are present, seek emergency medical assistance immediately. Call 9-1-1 and also record the time that the symptoms first presented. Being aware of the warning signs and being prepared to respond to them quickly could be the difference between life and death for you or someone you love.

*All life is an  
experiment. The  
more  
experiments you  
make, the  
better.*

-Ralph Waldo Emerson

Happy New Year! I hope that everyone had a safe and happy holiday season. I know that 2015 will bring new adventures, opportunities, and happiness to you and your families.

Best Wishes,  
Vickie
